

iCapta ScanCollector

ScanCollector is an application for controlled reception and automated processing of e-mails, including their attachments.

- ✓ **Filtering of allowed email senders (blacklist+whitelist)**
- ✓ **Checking the embedded attachment and its format**
- ✓ **Email notification to the email sender**
- ✓ **Defining the output format and saving the email body as an**

What can ScanCollector do?

- Download emails from email sites
- Filter permitted recipients, check attachments and their format according to the given rules
- Inform the sender in case of non-compliance with the control

And much more...

The module checks specified email boxes for new emails with attachments.

At the same time, it applies pre-defined rules, and if the given message meets them, it automatically starts the process workflow for the processing of obligations.

ScanCollector uses the IMAP or Microsoft Graph protocol to communicate with the mailbox

We offer **ScanCollector** as an optional part of our digitization service or as a solution delivery.

With the use of ScanCollector services, you can check an unlimited number of email addresses intended for automated processing.
